---

## Exercises

---

1. Create a new directory called `workbench` in your home directory.
2. Without changing directories create a file called `readme.txt` inside of `workbench`.
3. Append the numbers 1, 2, and 3 to `readme.txt` so that each number appears on its own line.
4. Print `readme.txt` to the command line.
5. Use output redirection to create a new file in the `workbench` directory called `list.txt` which lists the files and folders in your home directory.
6. Find out how many characters are in `list.txt` without opening the file or printing it to the command line.
